## CONTENTS

<b>1</b>	<b>Polar Plot</b>	<b>1</b>
1.1	Introduction . . . . .	1
<b>2</b>	<b>Bode Plot</b>	<b>1</b>
2.1	Gain and Phase Margin . . .	1
<b>3</b>	<b>PID Controller</b>	<b>2</b>
3.1	Introduction . . . . .	2

**Abstract**—The objective of this manual is to introduce control system design at an elementary level.

Download python codes using

svn co <https://github.com/gadepall/school/trunk/control/ketan/codes>

## 1 POLAR PLOT

### 1.1 Introduction

## 2 BODE PLOT

### 2.1 Gain and Phase Margin

2.1. For a Transfer function  $G(s)$  in unity negative feedback, whose error  $K_v = 2$ . Determine  $K$

$$G(s) = \frac{K}{s(s+2)(s+4)(s+6)} \quad (2.1.1)$$

**Solution:** For unity feedback we have Velocity error constant ( $K_v$ )

$$K_v = \lim_{s \rightarrow 0} sG(s) \quad (2.1.2)$$

$$\lim_{s \rightarrow 0} \left( \frac{K}{(s+2)(s+4)(s+6)} \right) = 2 \quad (2.1.3)$$

$$\Rightarrow K = 96 \quad (2.1.4)$$

It's Phase Margin =  $19^\circ$

and Gain Crossover Frequency = 1.49 rad/s

2.2. Design a lead Compensator to yield a Phase margin of  $30^\circ$

**Solution:** So, we need a phase lead of 11 at the gain crossover frequency, Using a lead Compensator  $C(s)$ .

$$C(s) = \frac{(s+a_1)}{(s+a_2)} \quad (2.2.1)$$

Now choose  $a_1$  and  $a_2$  ( $a_1 < a_2$ ) such that, phase lead of Compensator is 11, and has negligible gain.

$$a_1 = 1.28 \quad (2.2.2)$$

$$a_2 = 1.6 \quad (2.2.3)$$

Refer Fig2.3 for plot  $C(s)$ .

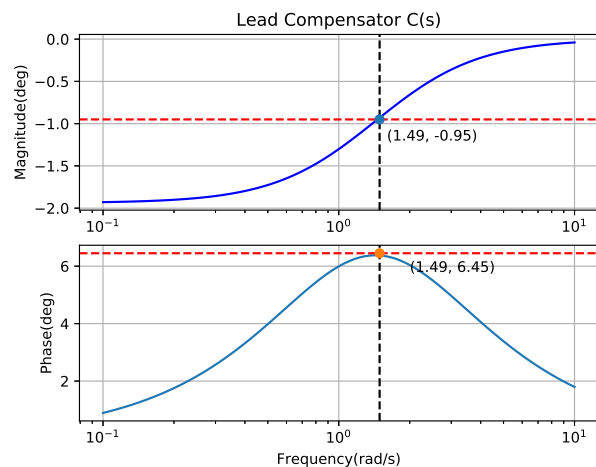

Fig. 2.2

2.3. Plot overall graph after adding lead compensator. Refer Fig2.2 for plot  $C(s)G(s)$ .

[codes/ee18btech11049/full.py](https://github.com/gadepall/school/trunk/control/ketan/codes/ee18btech11049/full.py)

**NOTE :** Gain is definitely added by Lead compensator, which increases gain crossover frequency. This points should be noted while designing a controller, and parameters to be changed accordingly to get exact results.
